AIM: Conduct takeoffs, circuits, and landings in 5–15 kt crosswind using correct technique throughout.

DP **Circuit 1**: Instructor demos full crosswind circuit and patters all corrections; student applies from circuit 2 ☐

P **Practice**: student practices crosswind circuits; ensure requirements below met ☐

DP **Alternative technique**: instructor demonstrates the second crosswind technique at some stage (if starting with wing-down/forward-slip, demonstrate crabbed); student practices using both ☐

TECHNIQUE REFERENCE

- **Wing-down/Forward-Slip**: Into-wind aileron + downwind rudder from 500 feet on final; upwind wheel first on touchdown
- **Crabbed**: Maintain crab on final; transition to slip when runway assured (around 50 feet)
- **Post-touchdown**: Into-wind aileron maintained; aileron effectiveness reduces as speed reduces
- **Aircraft limit**: 15 kt . **Solo limit**: 5-8 kt

REQUIREMENTS

- **300 ft stable gate respected**: verbalise "stable"
- **WCA**: applied on every circuit leg
- **TGL**: flaps reconfigured before power applied, crosswind technique applied
- **Aircraft limit**: 15 kt . **Solo limit**: 5-8 kt

COMMON ERRORS

- **Nose for alignment** -> Use body (chest/legs); parallax from left seat
- **Rudder for drift** -> Aileron corrects drift; rudder keeps straight
- **Insufficient aileron on rollout** -> Maintain — upwind wing will lift
- **No WCA in circuit** -> Hold it; don't chase the runway
- **Airspeed fixation** -> in gusty conditions hold *attitude* do not chase airspeed
- **Conditions far exceeding student skill** -> No need to push, if instructor is constantly intervening on controls or progress is regressing, consider another activity

STANDARDS FOR PROGRESSION

P S C NC

Solo (S) — two separate flights in 5-8 kt xwind: Technique briefed; drift controlled; ASI +5/-0 kt; aileron through rollout; gate without prompting

Note: Training dual continues to 15 kt; solo not permitted above 8 kt

⚠️ **SAFETY** Crosswind 5-15 kt dual . **5-8 kt solo only** . Heightened monitoring during hold-off . Take control if directional control lost . Monitor student fatigue. If student progress is regressing, consider different activity
