

AIM: Turn to a preselected heading at a predetermined angle of bank, maintaining altitude and balance.

P E8 Takeoff: Student with minimal prompting; pre-takeoff brief initiated independently

☐

D Parallax: Show horizon difference L vs R turn

☐

P Slow flight: Student establishes slow flight using PAT -> LARI

☐

D Adverse yaw: Aileron alone – show yaw opposite to aileron input (more effective in slow flight)

☐

DP 30° turn: Return to 5000RPM cruise. Demo turn (Lookout, BBB); student practices L and R

☐

DP 15° turn: Lookout, Bank, Balance, Backpressure; student practices L and R

☐

DP Climbing turn 15°: Note reduced climb; student practices; exit APT

☐

DP Descending turn 30°: Note underbanking; student practices; exit PAT

☐

P Scenario: 15° and 30° turns around a ground feature at 2500 ft, transition to climbing and descending turn

☐

COMMON ERRORS

- **Looking into the turn** -> Select reference first; look **forward** during turn
- **Altitude loss** -> Check bank first; then backpressure
- **Uncoordinated entry/exit** -> Rudder **with** aileron – not after
- **No pre-turn lookout** -> Non-negotiable before every turn

STANDARDS FOR PROGRESSION

P S **Progressing (P):** Bank $\pm 5^\circ$, alt ± 200 ft; rollout $\pm 20^\circ$; lookout with occasional prompting

Solo (S): Bank $\pm 5^\circ$, alt ± 150 ft; rollout $\pm 10^\circ$; pre-turn lookout without prompting

C NC

⚠ SAFETY Exercises **above 1000 ft AGL**. Monitor spiral tendency if bank exceeds 30° . Clear horizon and surface wind <25 knots
